For the first part to connect to the TTN I have chosen Node-Red as the subscriber which connects to the InfluxDB. And then I have dockerized the lab.

At the first point I was able to figure it how to complete the task but after keep on learning and getting suggestions from the professor I understood the concept and tried to fix the issues I had.

The Lab was interesting and I feel I have completed it neatly, the lab was too long and too much information in it, for the first time it has blown me with the information but the information was relevant.
